

1 - contiguous

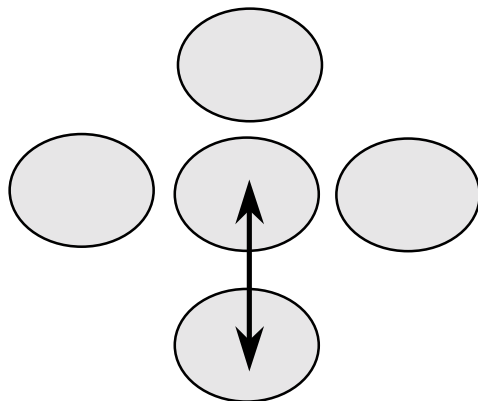

2 - gaps

3 - patchy

4 - isolated

5 - scarce

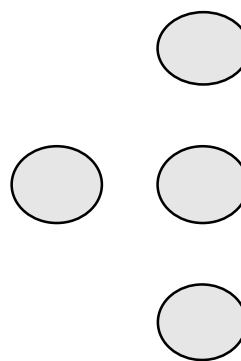

Fig. 2 --Conceptual diagram of the five habitat outcome classes developed by Lehmkuhl and others (1997) to assess effects of planning alternatives on selected plants and animals within the Interior Columbia Basin. Classes are defined in text. Results of the habitat outcome-based analysis were used as part of the criteria by which broad-scale species of focus were selected for analysis of source habitats.
